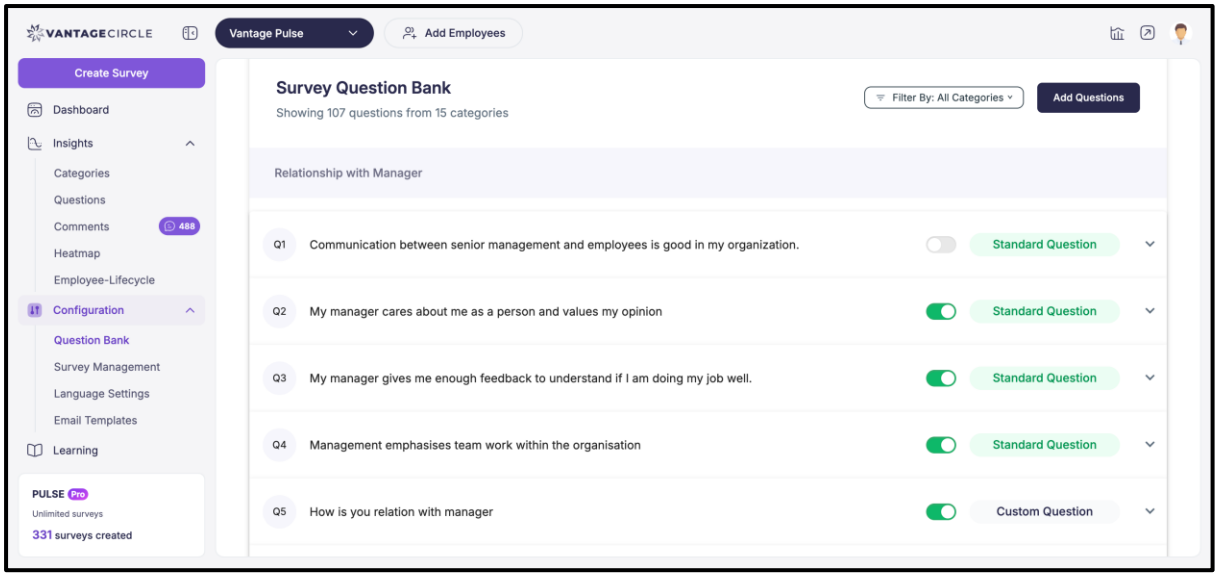
Vantage Pulse - Step-by-Step Guide (Configuration & Reports) for HRs & Admins

Navigating the Configuration Section in Vantage Pulse



The **Configuration** module in Vantage Pulse is where administrators set up and control the core survey settings of the platform.

This section allows you to manage questions, surveys, language preferences, and communication templates that will be used while creating and running surveys.

The first section under Configuration is the **Question Bank**.

The **Question Bank** is a centralized repository of all survey questions available in Vantage Pulse. Questions are organized into categories such as Relationship with Manager, Engagement, Recognition, and more.

Each question is labeled as:

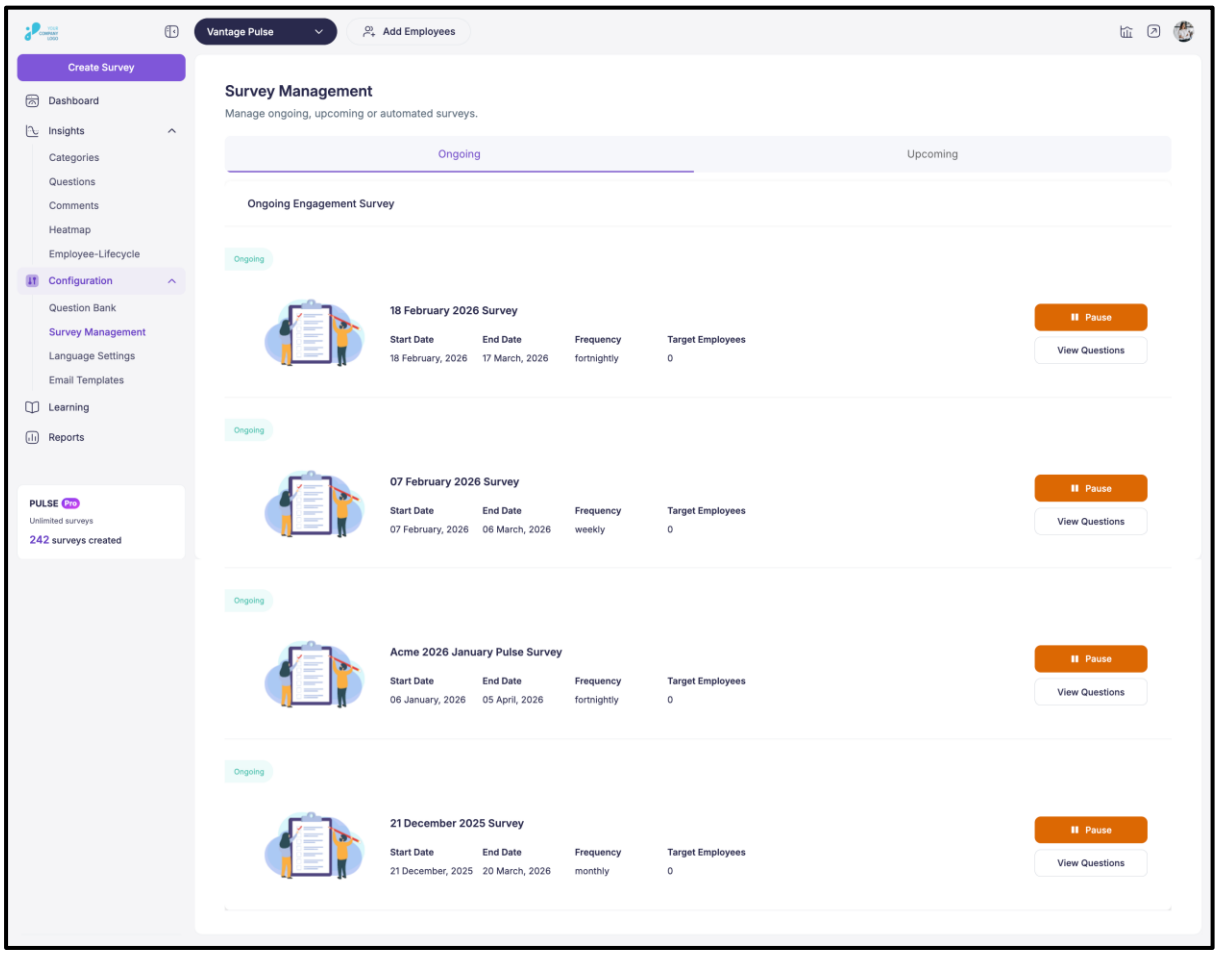
- **Standard Question** – platform-recommended questions
- **Custom Question** – questions created by your organization

From this section, you can:

- Enable or disable questions using the toggle next to each question
- Filter questions using **Filter by: All Categories**
- Add new questions by clicking **Add Questions**

The Question Bank controls which questions can be used while creating surveys, allowing organizations to customize surveys based on their requirements.

Survey Management



The **Survey Management** section allows administrators to manage all surveys that have already been created.

Surveys are organized into two tabs:

- **Ongoing** – surveys that are currently active and collecting responses
- **Upcoming** – surveys scheduled to start in the future

For each survey, you can view basic details such as:

- Start Date

- End Date
- Frequency
- Target Employees

You can also:

- **Pause** an active survey whenever required
- Click **View Questions** to see the questions included in that survey along with the question type (Rating, MCQ, or Open-ended) and whether a question is mandatory.

This section helps you monitor and control active survey runs without recreating or editing the survey setup.

Language Settings

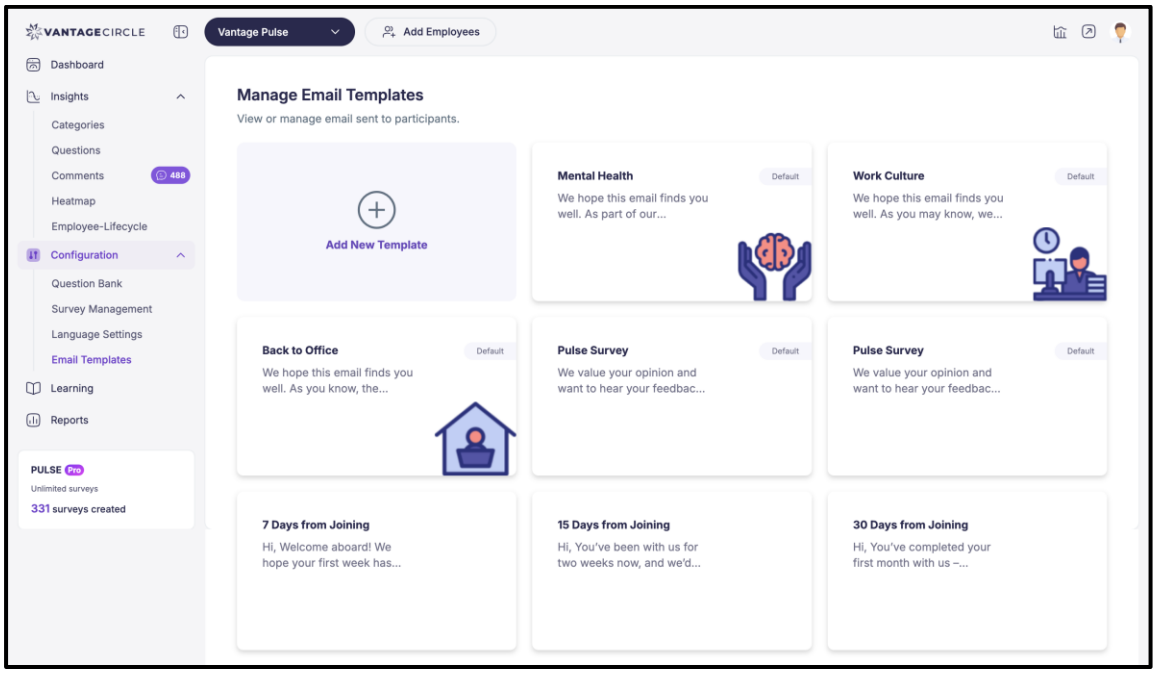
The **Language Settings** section allows administrators to configure the languages available for surveys across the organization.

Here you can:

- Search and select multiple languages that will be available for survey translations
- Make these languages accessible to HR admins while creating custom questions
- Set a **Default Language**, which will act as the primary language for all surveys

This ensures employees can take surveys in a language they are comfortable with while maintaining a single default language for reporting and consistency.

Email Templates



The **Email Templates** section allows you to manage the emails that employees receive when a survey is triggered.

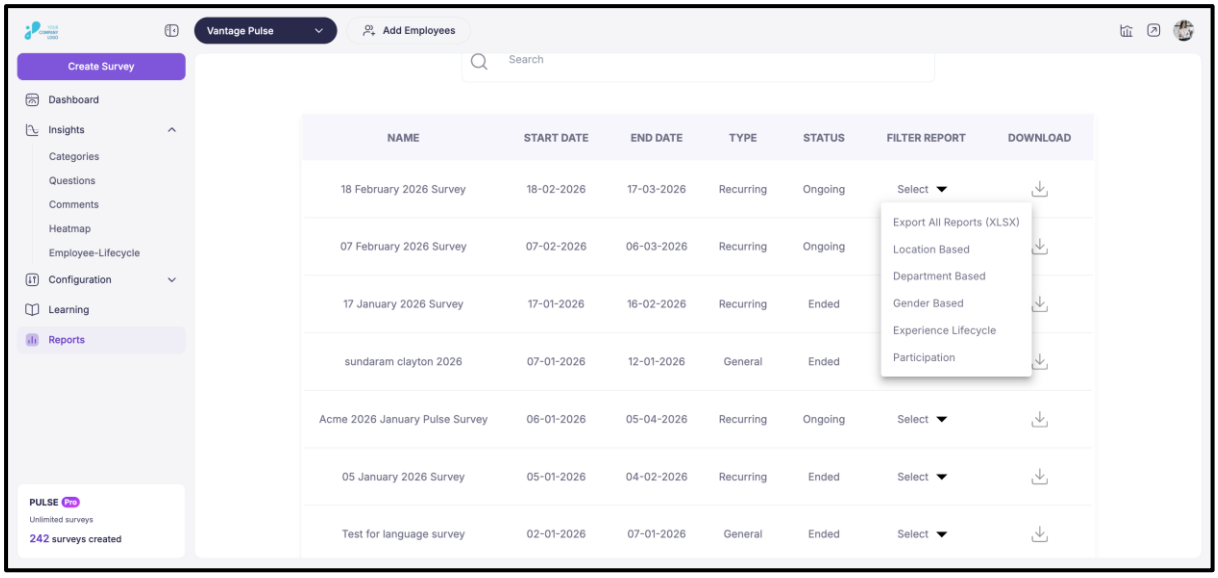
Here you can:

- View all available templates (Pulse surveys, onboarding surveys, and anniversary surveys)
- Create a new template using **Add New Template**
- Edit existing templates to customize subject and email content
- Set or modify default templates used during automated surveys

Templates are organized based on different survey events such as joining milestones (7, 15, 30, 45, 60, 90 days) and work anniversaries (1 year, 2 years, etc.).

Any changes made here will reflect in the actual invitation emails employees receive when a survey is sent.

Reports



The **Reports** section allows you to download and share survey data for further analysis and record-keeping.

On this page you can see all surveys along with:

- Survey name
- Start date and end date
- Survey type (Recurring / General)
- Current status (Ongoing or Ended)

From here you can:

- Use **Filter Report** to export specific datasets (Location-based, Department-based, Gender-based, Experience Lifecycle, or Participation)
- Export **All Reports (XLSX)** for complete data
- Download individual survey reports using the download icon

This section is mainly used by HR teams and administrators to analyze results outside the dashboard, create presentations, and maintain internal records.
